

Operation:

LCO-203 has 3 daylight ON/OFF Switching zones. Each zone will switch off sequentially as the daylight level increases. The TS-400-24 is a timer switch. It is used to override the daylighting control.

Notes

1. A jumper is required between A8 and A11 if occupancy sensor is not used.
2. Maximum of 620 W per power pack relay.
3. All low voltage wiring must be isolated from line voltage wiring.

General Note:

Press the button on the TS-400-24 to turn lights on to full. The lights will remain on at full until button is pressed again or the timer times out. In both cases, the LCO resumes automatic daylighting control.
